PART 2 Owl Pellet Dissection

Today, we will search for skulls in our owl pellets. These are the skulls and bones of animals that the owl has eaten. You may find many skulls and bones in your pellet!

Place a check mark on the line as you complete the following steps:

1. Write your name on the lid of your Petri dish with a Sharpie. This container will store the skulls and bones you find so that you may take them home.
2. Unwrap the foil from the owl pellet.
   - If you are doing a dry dissection, gently pull the pellet into two halves. You can use your fingers!
   - If you are doing a wet dissection, place your owl pellet in a petri dish filled with water. Soak pellet for 10 minutes.
3. Use the tweezers to pull apart the soft material surrounding the skull and bones.
4. Place any skulls and bones you find on your clean paper napkin.
5. Observe the bones with your hand lens, and try to match the mandibles with their craniums.
6. Spread out a layer of cotton ball padding in the bottom of your petri dish.
7. Place the clean skulls and bones you found on this layer of cotton balls.
8. Use the dichotomous key to determine what prey your owl ate.
9. Close the lid of your Petri dish and tape it together.
10. Clean your work area according to the teacher’s instructions and wash your hands.
11. Record the number of skulls for each prey species you find on the What Do Owls Eat? worksheet.
